

# Continuous Assurance

Smart agri-food supply chain of the future

Dr Robert Barlow | 15th February 2023

Australia's National Science Agency

1

## CSIRO Missions

Goal	Trusted Agrifood Exports		
	Growing Australian agriculture through premiums for agrifood exports		
Delivery vehicles	<b>Improving market access</b> Modernised, evidence based standards for meeting the requirements set by importing countries 	<b>Automating export compliance</b> Digital compliance process incorporating remote data capture technologies 	<b>Verifying credentials</b> Establishing national provenance infrastructure to validate where/how food was produced 
	Underpinning	Customer trust	
Sensors and technology			
Data-sharing			

2

## Food safety & quality management

- Australia has a reputation for providing agri-food products globally that are clean, green and wholesome
- Trust in Australian agri-food products is critical
- Policies, procedures and processes designed to deliver safe and suitable foods
  - Legislation, regulations, standards, guidelines, and clients
- Food safety and quality audits
- Internal compliance evaluation – QA/QC

“Buyers often believe that auditors are performing a full verification of every product and process of food production” (Doug Powell)

3

## Things can go wrong

4

## Current situation

- Supply chains generate and collect substantial volumes of data each day that are currently under-utilised to assure processes are compliant and safe and suitable products are produced.
- Data is rarely collected on a continuous basis (automated, digital). Often it's collected manually and provides a snapshot of the system's performance.
- Datasets are often siloed and are poorly leveraged within the business for continuous improvement opportunities.

5

## Future state – Continuous Assurance

- The permissioned sharing of connected datasets, insights and analytics would enable industry, auditors, regulators and credentialing bodies to work together to improve both domestic and export market access.

### Loss avoidance

- Risk mitigation
- Lag indicators shift to lead indicators

### Reducing duplication

- Measure/analyse once and report to many

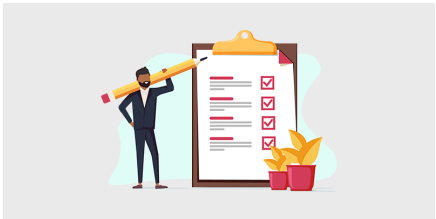

### Premiumisation of products

- Continually assured products
- Brand differentiation, new markets

6

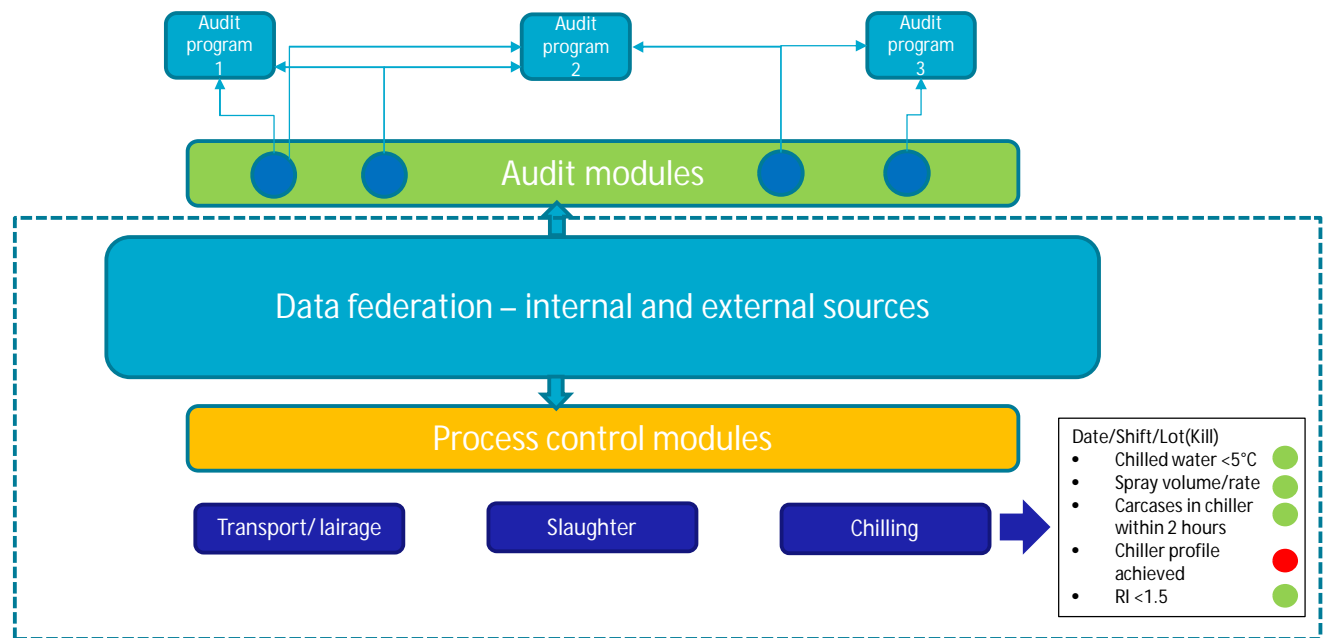

## CA – operational hygiene

- Current
    - QC Officer observes 3 x 5 mins/shift
    - QC checklist
      - PPE & apparel checks
      - Hand-washing
      - Boot scrub/wash
  - Might assess 30/500+ staff
- 
- Future
    - AI and camera observes 24/7
    - Results for each individual in 20 mins
      - Identity
      - PPE & apparel
      - Hand-washing (all aspects)
      - Boot scrub/wash (all aspects)
      - Jewellery, watches, unacceptable items
      - Transit time
  - All staff, every shift, every day
  - Weekly compliance reported

7

## Continuous Assurance – red meat

8

# Continuous assurance - MVP

- Demonstrate the ability to federate data sources from disparate locations and systems to enable enhanced insights, trends and analytics.
- MAP these activities
  - SOPs, SWI's
  - Where, what, how

Connect the present

Address the gaps, opportunities to add sensors/automate/digitise

Expand and scale

- Two distinct categories
  - Measurement-based
  - Human behaviour-based

9

# Compliance Mapping – what & where

Animals being transported	Animals at lairage	Slaughter	Offal	Chiller	Grading / marshalling	Boning room
Time of truck departure - date and time recorded via NVD scanned into system	Time off feed to not exceed 24 hours from departing property, date and time (departure) on NVD, kill time in system	Date and time of slaughter recorded against NUS #	Sterilisers (including visceral table wash) must exceed 82°C - manual checks by QC	Chilled water at <5°C, possibly captured in system, also note difference to chiller room.	Carcass surface temps and RI confirmed by graders - reported in system	Carcasses scanned into boning room. Boning room entry time is known
Time of truck arrival, date and time written on NVD (free form) - scanned into system	Time from departing property to slaughter not to exceed 36 hours - Departure time on NVD and kill time recorded at knocking box	Handwashing water must be 24-45°C - measure by QC	Pericardium cannot exceed 3hr rise cycle - 3 rise cycles can be completed in 5 mins.	Carcasses must enter chiller within 3 hours of slaughter (see slaughter to chiller delivery of carcasses, check time between slaughter to chiller)	Carcass temps confirmed as <10°C prior to boning	Carcass flock wash and steriliser baths >82°C - manual checks by QC
Route taken by truck, including any stops - max currently recorded	Attest motion inspection to occur within 24 hours of arrival (12 hours for some product codes e.g BUS, Data recorded)	Ice transition before de-bagging for 1 hour and not resealed opened thereafter. Re-sealed, 100% must always be 100% sealed. Carcasses treated within 10-30 minutes (QC watch)	Chilled offal shall be <5°C within 23 hours or further refrigeration is required	Chiller temperatures - measured in real time (outlet air)	Eye muscle temps measured as part of pH measurements, recorded in system with pH	Boning room temperature must be <10°C. Temperature data from 12 sensors (see below) 100% live data available. QC measure multiple times throughout shift
Environmental conditions during journey, temperature and humidity available from BOM	Lairage temperature - not currently captured!! opportunity for BOM plus in shade sensors	Steriliser temperatures must exceed 82°C - manual checks by QC	Trim (tripe/ibles) - temp to be below 30°C	Shrink tunnel and surface product, moisture and fat content in chiller system, for use by RI. (image) product labels for use by graders, which are used to RI	Grader RI confirmation - Tinytags and manual	Boning room temp sensors
Which animals are transported. Full ear tag scan on load, PE, number on NVD - NVD scanned into system		All sterilisers, fail from centralised source - output temps not recorded	Glycol system maintains chilled water at <4°C, possibly captured in system	Spring pH position - open to system. These measurements of water used per chiller not recorded. Verified as weight comparison during marshalling	Shrink tunnel must be >82°C - QC view readout on tunnel	
		Time from slaughter to HSCW / chiller entry must not exceed 2 hours	Lower offal room maintained at <10°C	Temp/RI sensors - open to system. These measurements of water used per chiller not recorded. Verified as weight comparison during marshalling		Temp in boning - can be determined by noting time body inspection and last body retention out for each boning run
		Breeder not stowed into crates and processing time of slaughter unfinished, trading QR scanning system on route	Offal into VRT within 2 hours of slaughter	Temp/RI sensors - open to system. These measurements of water used per chiller not recorded. Verified as weight comparison during marshalling		
		Temp, humidity, air flow of slaughter floor - not measured possible opportunity??				

10

# CSIRO Compliance Mapping - how

Animals being transported	Animals at lairage	Slaughter	Offal	Chiller	Grading / marshalling	Boning room
Time of truck departure - date and time recorded on NVD - scanned into system	Time off feed to not exceed 32 hours from departing property - date and time (departure) on NVD, kill time in system	Date and time of slaughter recorded against NLIS #	Sterilisers (including viscera table wash) must exceed 82°C - manual checks by QC	Glycol system maintains chilled water at <5°C - possibly captured in systems - also note differences to offal room	Carcass surface temps and RI confirmed by graders - reported in system	Carcasses scanned into boning room. Boning room entry time is known
Time of truck arrival - date and time written on NVD (free form) - scanned into system	Time from departing property to slaughter not to exceed 36 hours - Departure time on NVD and kill time recorded at knocking box	Handwashing water must be 34-45°C - measure by QC	Pericardium cannot exceed 3hr rinse cycle - 3 rinse cycles can be completed in 5 mins	Chiller temperatures measured in real time (outlet air)	Carcass temps confirmed as <10°C prior to boning	Carcass hook wash and steriliser baths - >82°C - manual checks by QC
Route taken by truck, including any stops - not currently recorded	Anti-mortem inspection to occur within 24 hours of arrival (12 hours for some product claims e.g. BLS) - data recorded	Is a scalding bath on hand by 1 hour and then manually cooled hot water - Pericardium 30 min deep-water 100°C minimum (30°C water)	Chilled offal shall be <5°C within 23 hours or further refrigeration is required	Chiller temperatures measured in real time (outlet air)	Eye muscle temps measured as part of pH measurements - recorded in system with pH	Boning room temperature must be <10°C - data time data on NVD - not required in QC measure - manual check on temperature
Environmental conditions during journey - temperature and humidity available from BDM	Lairage temperature - not currently captured?? opportunity for BDM plus in shade sensors	Steriliser temperatures must exceed 82°C - manual checks by QC	Trim (tripe/bibles) - temp to be below 30°C	Deep bath and surface probe - manual and automatic - captured in system - not used for RI - instead graders report manual checks which are used for RI		Boning room temp sensor
Which animals are transported - NLI or tag scan on load, PIC number on NVD - NVD scanned into system		All sterilisers fed from centralised source - output temps not recorded	Glycol system maintains chilled water at <4°C - possibly captured in system	Grader RI confirmation - Tinytags and manual		Shrink tunnel must be >82°C - QC view readout on tunnel
		Time from slaughter to HSCW / chiller entry must not exceed 2 hours	Lower offal room maintained at <10°C	Spring and gearbox - scan in system - from development of water used for chiller not recorded - verified via weight comparison during marshalling		Time in boning - can be determined by noting first body in motion out and last body in motion out for each boning run
		Bodies not scanned into chiller and boning area of slaughter unknown, trailing QR scanning system in hooks	Offal into VRT within 2 hours of slaughter	Temperature inside BDM - Paid based on temperature on NVD - not required in QC measure - manual check on temperature		
		Temp, humidity, air flow of slaughter floor not measured - possible opportunity??

12

## Multi-modal sensing

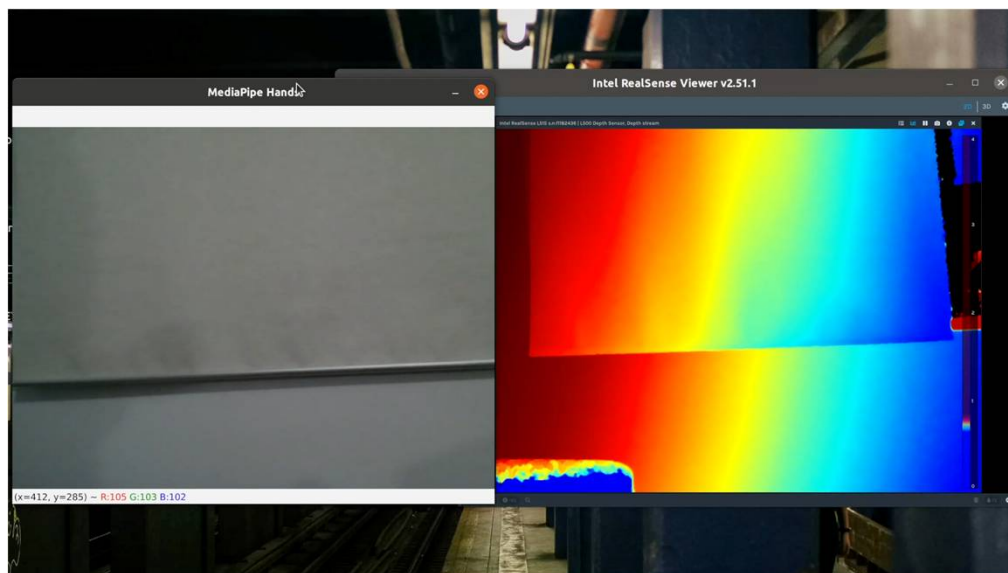

- Multiple sensing modalities improve activity recognition accuracy and robustness
  - LiDAR (long range), Time-of-Flight camera (close range), RGB camera, infrared camera, accelerometer, Bluetooth localisation
- Benefits
  - Accurate measurement of the interactions in physical environment – human behaviour/actions

13

## Lightweight solution – time-of-flight camera & jetson

14

## Benefits of CA

Leverage existing and new data on a continuous basis

Provide trust (confidence, explainable) in data and outcomes

Generate confidence for decisions and reuse of data and commercial outcomes

Less reactive interventions replaced with proactive measures

Reduction in duplication and effort of physical audits

Lift the industry by **working with** regulators to be continuously assured

Facilitate automated sharing of trusted data and outcomes to auditors, regulators and credentialing bodies to enhance market access

15

## Thank-you

Dr Robert Barlow
